7 An open ended cylinder is subjected to an internal pressure.
(a) What is the longitudinal stress?

Answer - zero since no longitudinal force can be produced in the walls.
(b) Sketch a practical arrangement that allows an open ended cylinder to have internal pressure.

(c) Calculate the increase in the internal diameter of an open ended cylinder given the following data.

| Outer Diameter | 200 mm |
| :--- | :--- |
| Inner Diameter | 140 mm |
| Internal Pressure | 100 MPa |
| Young's Modulus | 200 GPa |
| Poisson's ratio | 0.3 |

Wall thickness $=30 \mathrm{~mm} \mathrm{D} / \mathrm{t}=200 / 30=6.7$ so it should be treated as a thick cylinder.
Lame's equations
$\sigma_{R}=a-\frac{b}{r^{2}} \quad \sigma_{C}=a+\frac{b}{r^{2}}$
The boundary conditions are
Inner surface $r=70 \mathrm{~mm} \sigma_{R}=-100 \mathrm{MPa}$ (compressive)
Outer surface $\mathrm{r}=100 \mathrm{~mm} \sigma_{\mathrm{R}}=0 \mathrm{MPa}$ (compressive)
Substituting into Lame's equation we have
$\sigma_{\mathrm{R}}=-100 \times 10^{6}=\mathrm{a}-\mathrm{b} / \mathrm{r}^{2}=\mathrm{a}-\mathrm{b} / 0.07^{2}$
$\sigma_{R}=0=a-b / r^{2}=a-b / 0.1^{2} \quad a=100 b$
substitute
$-100 \times 10^{6}=100 b-204.08 b=-104.08 b \quad b=960 \times 10^{3}$
$a=96.08 \times 10^{6}$
Now solve the circumferential stress. $\quad \sigma_{c}=a+b / r^{2}$
Putting $\mathrm{r}=0.1 \quad \sigma_{\mathrm{c}}=192 . \mathrm{MPa}$
Putting $\mathrm{r}=0.07 \sigma_{\mathrm{c}}=292 \mathrm{MPa}$
There are two mutually perpendicular stresses at the inner surface of 292 MPa (tensile) and 100 MPa (compressive)
$\varepsilon_{\mathrm{c}}=\frac{1}{\mathrm{E}}\left[\sigma_{\mathrm{c}}-v \sigma_{\mathrm{r}}\right]=\frac{1}{200}\left[292 \times 10^{6}-0.3\left(-100 \times 10^{6}\right]=1.611 \times 10^{-3}\right.$
Circumferential strain is the same as the diametral strain $\varepsilon_{c}=\Delta \mathrm{d} / \mathrm{d}$
Change in diameter $=\Delta d=\varepsilon_{c} d=1.611 \times 10^{-3} \times 140=0.225 \mathrm{~mm}$
