## TUTORIAL No.8B

## CENTRIFUGAL PUMPS

When you have completed this tutorial you should be able to

- Derive the dimensionless parameters of a pump
- Flow Coefficient
- Head Coefficient
- Power Coefficient
- Specific Speed.
- Explain how to match a pump to system requirements.
- Explain the general principles of Centrifugal Pumps.
- Construct blade vector diagrams for Centrifugal Pumps.
- Deduce formulae for power and efficiency and Head.
- $\quad$ Solve numerical problems for Centrifugal Pumps.

## 1. DIMENSIONAL ANALYSIS

The power ' P ' of any rotary hydraulic pump depends upon the density ' $\mathrm{\rho}$ ' , the speed ' N ', the characteristic diameter ' D ', the head change ' $\Delta \mathrm{H}$ ', the volume flow rate ' Q ' and the gravitational constant ' g '. The general equation is:

$$
\mathrm{P}=\mathrm{f}(\rho, \mathrm{~N}, \mathrm{D}, \Delta \mathrm{H}, \mathrm{Q}, \mathrm{~g})
$$

It is normal to consider $g \Delta H$ as one quantity. $P=f\{\rho, N, D,(g \Delta H), Q\}$
There are 6 quantities and 3 dimensions so there are three dimensionless groups $\Pi_{1}, \Pi_{2}$ and $\Pi_{3}$. First form a group with P and $\rho$ ND.
$P=\varphi(\rho N D)=\Pi_{1} \rho^{a} N^{b} D^{c}$
$\mathrm{M}^{1} \mathrm{~L}^{2} \mathrm{~T}^{-3}=\left(\mathrm{ML}^{-3}\right)^{\mathrm{a}}\left(\mathrm{T}^{-1}\right)^{\mathrm{b}}\left(\mathrm{D}^{1}\right)^{\mathrm{c}}$
Mass $1=\mathrm{a}$
Time $-3=-b \quad b=3$
Length $2=-3 \mathrm{a}+\mathrm{c}=-3+\mathrm{c} \quad \mathrm{c}=5$
$\mathrm{P}=\Pi_{1} \rho^{1} \mathrm{~N}^{3} \mathrm{D}^{5} \quad \Pi_{1}=\frac{\mathrm{P}}{\rho \mathrm{N}^{3} \mathrm{D}^{5}}=$ Power Coefficient
Next repeat the process between Q and $\rho \mathrm{ND}$
$\mathrm{Q}=\varphi(\rho \mathrm{ND})=\Pi_{2} \rho^{\mathrm{a}} \mathrm{N}^{\mathrm{b}} \mathrm{D}^{\mathrm{c}}$
$M^{3} T^{-1}=\left(M L^{-3}\right)^{a}\left(T^{-1}\right)^{b}\left(D^{1}\right)^{c}$
Time $-1=-\mathrm{b} \quad \mathrm{b}=1$
Mass $0=\mathrm{a}$
Length $3=-3 a+c \quad c=3$
$\mathrm{Q}=\Pi_{2} \rho^{0} \mathrm{~N}^{1} \mathrm{D}^{3} \quad \Pi_{2}=\frac{\mathrm{Q}}{\mathrm{ND}^{3}}=$ Flow Coefficient
Next repeat the process between $g \Delta H$ and $\rho N D$
$(\mathrm{g} \Delta \mathrm{H})=\varphi(\rho \mathrm{ND})=\Pi_{3} \rho^{\mathrm{a}} \mathrm{N}^{\mathrm{b}} \mathrm{D}^{\mathrm{c}}$
$M^{0} L^{2} T^{-2}=\left(M L^{-3}\right)^{a}\left(T^{-1}\right)^{b}\left(D^{1}\right)^{c}$
Mass $0=\mathrm{a} \quad$ Time $-2=-\mathrm{b} \quad \mathrm{b}=2 \quad$ Length $2=-3 \mathrm{a}+\mathrm{c} \quad \mathrm{c}=2$
$\mathrm{Q}=\Pi_{3} \rho^{0} \mathrm{~N}^{2} \mathrm{D}^{2} \quad \Pi_{3}=\frac{\mathrm{Q}}{\mathrm{N}^{2} \mathrm{D}^{2}}=$ Head Coefficient
Finally the complete equation is $\frac{P}{\rho N^{3} D^{5}}=\varphi\left(\frac{Q}{N D^{3}}\right)\left(\frac{g \Delta H}{N^{2} D^{2}}\right)$

## SPECIFIC SPEED Ns

The specific speed is a parameter used for pumps and turbines to determine the best design to match a given pumped system. The formula may be derived from consideration of the pump geometry or
by dimensional analysis. The latter will be used here.

$$
\frac{\mathrm{P}}{\rho \mathrm{~N}^{3} \mathrm{D}^{5}}=\varphi\left(\frac{\mathrm{Q}}{\mathrm{ND}^{2}}\right)\left(\frac{\mathrm{g} \Delta \mathrm{H}}{\mathrm{~N}^{2} \mathrm{D}^{2}}\right)
$$

The three dimensionless numbers represent the power coefficient, the flow coefficient and the head coefficient respectively. Now consider a family of geometrically similar machines operating at dynamically similar conditions. For this to be the case the coefficients must have the same values for each size. Let the 3 coefficients be $\Pi_{1}, \Pi_{2}$ and $\Pi_{3}$ such that
$\Pi_{1}=\frac{\mathrm{P}}{\rho \mathrm{N}^{3} \mathrm{D}^{5}} \quad \Pi_{2}=\frac{\mathrm{Q}}{\mathrm{ND}^{3}} \quad \mathrm{D}=\left(\frac{\mathrm{Q}}{\mathrm{NH}_{2}}\right)^{\frac{1}{3}} \quad \Pi_{3}=\frac{\mathrm{g} \Delta \mathrm{H}}{\mathrm{N}^{2} \mathrm{D}^{2}} \quad \mathrm{D}=\left(\frac{\mathrm{g} \Delta \mathrm{H}}{\mathrm{N}^{2} \Pi_{3}}\right)^{\frac{1}{2}}$
Equating $\left(\frac{\mathrm{Q}}{\mathrm{NH}_{2}}\right)^{\frac{1}{3}}=\left(\frac{\mathrm{g} \Delta \mathrm{H}}{\mathrm{N}^{2} \Pi_{3}}\right)^{\frac{1}{2}}$
$\frac{1}{N}\left(\frac{\mathrm{~g} \Delta \mathrm{H}}{\Pi_{3}}\right)^{\frac{1}{2}}=\frac{\mathrm{Q}^{\frac{1}{3}}}{\Pi_{2}^{\frac{1}{3}} \mathrm{~N}^{\frac{1}{3}}}$
$\frac{(\Delta \mathrm{H})^{\frac{1}{2}}}{\underline{1} \frac{2}{3}}=\frac{\Pi_{3}^{\frac{1}{2}}}{\underline{1} \frac{1}{2}}=$ constant
$\mathrm{Q}^{\overline{3}} \mathrm{~N}^{\overline{3}} \quad \Pi_{2}^{\overline{3}} \mathrm{~g}^{\overline{2}}$
$\frac{(\Delta \mathrm{H})^{\frac{1}{2}}}{\frac{1}{3}}=\mathrm{N}^{\frac{2}{3}}$
$K^{\overline{3}}$
$\left[\frac{(\Delta H)^{\frac{1}{2}}}{K^{\frac{1}{3}}}\right]^{\frac{3}{2}}=N=\frac{(\Delta H)^{\frac{3}{4}}}{K^{\frac{1}{2}} Q^{\frac{1}{2}}} \quad \frac{\mathrm{NQ}^{\frac{1}{2}}}{(\Delta H)^{\frac{3}{4}}}=\mathrm{K}^{-\frac{1}{2}}=$ constant
This constant is called the Specific Speed $\mathrm{Ns}=\frac{\mathrm{NQ}^{\frac{1}{2}}}{\underline{3}}$
$(\Delta \mathrm{H})^{4}$
Ns is a dimensionless parameter that and the units used are normally rev/min for speed, $\mathrm{m} 3 / \mathrm{s}$ for flow rate and metres for head. Other units are often used and care should be taken when quoting Ns values.

It follows that for a given speed, the specific speed is large for large flows and low heads and small for small flows and large heads. The important value is the one that corresponds to the conditions that produce the greatest efficiency.

## 2. MATCHING PUMPS TO SYSTEM REQUIREMENTS

The diagram shows a typical relationship between the head and flow of a given CF pump at a given speed.

Figure 1
The Ns value may be calculated using the flow and head corresponding to the maximum efficiency at point A.

## SELECTING PUMP SIZE

The problem is that the optimal point of any given pump is unlikely to correspond to the system requirements for example at point B . What we should do ideally is find a geometrically similar pump that will produce the required head and flow at the optimal point.

The geometrically similar pump will run under dynamically similar conditions so it follows that the specific speed Ns is the same for both pumps at the optimal point. The procedure is to first calculate the specific speed of the pump using the flow and head at the optimal conditions.
$\mathrm{N}_{\mathrm{s}}=\frac{\mathrm{N}_{\mathrm{A}} \mathrm{Q}_{\mathrm{A}}{ }^{\frac{1}{2}}}{\mathrm{H}_{\mathrm{A}}{ }^{\frac{3}{4}}}$
Suppose point B is the required operating point defined by the system.
$N_{s}=\frac{N_{B} Q_{B} B^{\frac{1}{2}}}{H_{B} \frac{3}{4}}$ Equating, we can calculate $N_{B}$, the speed of the geometrically similar pump.
We still don't know the size of the pump that will produce the head and flow at B. Since the head and flow coefficients are the same then:-
Equating Flow Coefficients we get $D_{B}=D_{A}\left(\frac{Q_{B} N_{A}}{Q_{A} N_{B}}\right)^{1 / 3}$
Equating head coefficients we get we get $D_{B}=\frac{N_{A}}{N_{B}} \sqrt{\frac{H_{B}}{H_{A}}}$
If the forgoing is correct then both will give the same answer.

## WORKED EXAMPLE No. 1

A centrifugal pump is required to produce a flow of water at a rate of $0.0160 \mathrm{~m}^{3} / \mathrm{s}$ against a total head of 30.5 m . The operating characteristic of a pump at a speed of $1430 \mathrm{rev} / \mathrm{min}$ and a rotor diameter of 125 mm is as follows.

| Efficiency | 0 | 48 | 66 | 66 | 45 | $\%$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathrm{Q}_{\mathrm{A}}$ | 0 | 0.0148 | 0.0295 | 0.0441 | 0.059 | $\mathrm{~m}^{3} / \mathrm{s}$ |
| $\mathrm{H}_{\mathrm{A}}$ | 68.6 | 72 | 68.6 | 53.4 | 22.8 | m |

Determine the correct size of pump and its speed to produce the required head and flow.

## SOLUTION

Plot the data for the pump and determine that the optimal head and flow are 65 m and $0.036 \mathrm{~m}^{3} / \mathrm{s}$

Calculate Ns at point A $\mathrm{N}_{\mathrm{s}}=\frac{\mathrm{N}_{\mathrm{A}} \mathrm{Q}_{\mathrm{A}}{ }^{\frac{1}{2}}}{\mathrm{H}_{\mathrm{A}}{ }^{\frac{3}{4}}}=\frac{1430 \times 0.036^{1 / 2}}{65^{3 / 4}}=11.85$
Calculate the Speed for a geometrically similar pump at the required conditions.
$\mathrm{N}_{\mathrm{B}}=\mathrm{Ns} \frac{\mathrm{H}_{\mathrm{B}^{\frac{3}{4}}}^{\mathrm{Q}_{\mathrm{B}}{ }^{\frac{1}{2}}}}{=\frac{11.85 \times 30.5^{3 / 4}}{0.016^{1 / 2}}=1216 \mathrm{rev} / \mathrm{min}, ~}$
Next calculate the diameter of this pump.
$\mathrm{D}_{\mathrm{B}}=\mathrm{D}_{\mathrm{A}}\left(\frac{\mathrm{Q}_{\mathrm{B}} \mathrm{N}_{\mathrm{A}}}{\mathrm{Q}_{\mathrm{A}} \mathrm{N}_{\mathrm{B}}}\right)^{1 / 3}=125\left(\frac{0.016 \times 1430}{0.036 \times 1216}\right)^{1 / 3}=101 \mathrm{~mm}$
or $\mathrm{D}_{\mathrm{B}}=\mathrm{D}_{\mathrm{A}} \frac{\mathrm{N}_{\mathrm{A}}}{\mathrm{N}_{\mathrm{B}}} \sqrt{\frac{\mathrm{H}_{\mathrm{B}}}{\mathrm{H}_{\mathrm{A}}}}=125 \times \frac{1430}{1216} \sqrt{\frac{30.5}{65}}=101 \mathrm{~mm}$
Answer:- we need a pump 101 mm diameter running at $1216 \mathrm{rev} / \mathrm{min}$.

## RUNNING WITH THE WRONG SIZE

In reality we are unlikely to find a pump exactly the right size so we are forced to use the nearest we can get and adjust the speed to obtain the required flow and head. Let B be the required operating point and A the optimal point for the wrong size pump. We make the flow and head coefficients the same for B and some other point C on the operating curve. The diameters cancel because they are the same.
$\frac{Q_{B}}{N_{B} D_{B}{ }^{3}}=\frac{Q_{C}}{N_{C} D_{C}{ }^{3}} \quad Q_{B}=Q_{C} \frac{N_{B}}{N_{C}}$
$\frac{\mathrm{g} \mathrm{H}_{\mathrm{C}}}{\mathrm{N}_{\mathrm{C}}{ }^{2} \mathrm{D}_{\mathrm{C}}{ }^{2}}=\frac{\mathrm{gH} \mathrm{H}}{\mathrm{N}_{\mathrm{C}}{ }^{2} \mathrm{D}_{\mathrm{C}}{ }^{2}} \quad \mathrm{H}_{\mathrm{B}}=\mathrm{H}_{\mathrm{C}} \frac{\mathrm{N}_{\mathrm{B}}{ }^{2}}{\mathrm{~N}_{\mathrm{C}}{ }^{2}}$
Substitute $\frac{N_{B}}{N_{A}}=\frac{Q_{B}}{Q_{A}}$ to eliminate the speed

$$
\mathrm{H}_{\mathrm{C}}=\mathrm{H}_{\mathrm{B}}\left(\frac{\mathrm{Q}_{\mathrm{C}}}{\mathrm{Q}_{\mathrm{B}}}\right)^{2}
$$

This is a family of parabolic curves starting at the origin. If we take the operating point $B$ we can determine point C as the point where it intersects the operating curve at speed A .
The important point is that the efficiency curve is unaffected so at point B the efficiency is not optimal.

Figure 2

## WORKED EXAMPLE No. 2

If only the 125 mm pump in WE 1 is available, what speed must it be run at to obtain the required head and flow? What is the efficiency and input power to the pump?

## SOLUTION

$B$ is the operating point so we must calculate $H_{C}$ and $Q_{C}$
$\mathrm{H}_{\mathrm{C}}=\mathrm{H}_{\mathrm{B}}\left(\frac{\mathrm{Q}_{\mathrm{C}}}{\mathrm{Q}_{\mathrm{B}}}\right)^{2}=30.5\left(\frac{\mathrm{Q}_{\mathrm{C}}}{0.016}\right)^{2}=119141 \mathrm{Q}_{\mathrm{C}}^{2}$
This must be plotted to determine $\mathrm{Q}_{\mathrm{C}}$
From the plot $\mathrm{H}_{\mathrm{C}}=74 \mathrm{~m}$
$\mathrm{Q}_{\mathrm{C}}=0.025 \mathrm{~m}^{3} / \mathrm{s}$
Equate flow coefficients to find the speed at B
$\frac{\mathrm{Q}_{\mathrm{B}}}{\mathrm{N}_{\mathrm{B}} \mathrm{D}_{\mathrm{B}}{ }^{3}}=\frac{\mathrm{Q}_{\mathrm{C}}}{\mathrm{N}_{\mathrm{C}} \mathrm{D}_{\mathrm{C}}{ }^{3}} \quad \frac{0.016}{\mathrm{~N}_{\mathrm{B}}}=\frac{0.025}{1430}$

$\mathrm{N}_{\mathrm{B}}=915 \mathrm{rev} / \mathrm{min}$
Check by repeating the process with the head coefficient.

$$
\frac{\mathrm{g} \mathrm{H}_{\mathrm{B}}}{\mathrm{~N}_{\mathrm{B}}{ }^{2} \mathrm{D}_{\mathrm{B}}{ }^{2}}=\frac{\mathrm{g} \mathrm{H}_{\mathrm{A}}}{\mathrm{~N}_{\mathrm{A}}{ }^{2} \mathrm{D}_{\mathrm{A}}{ }^{2}} \quad \mathrm{~N}_{\mathrm{B}}=\mathrm{N}_{\mathrm{A}} \sqrt{\frac{\mathrm{H}_{\mathrm{B}}}{\mathrm{H}_{\mathrm{A}}}}=1430 \sqrt{\frac{30.5}{74}}=918 \mathrm{rev} / \mathrm{min}
$$

The efficiency at this point is $63 \% \quad$ Water Power $=\mathrm{mgH}=16 \times 9.81 \times 30.5=4787 \mathrm{~W}$
Power Input $=\mathrm{WP} / \eta=4787 / 0.63=7598 \mathrm{~W}$

## WORKED EXAMPLE No. 3

A pump draws water from a tank and delivers it to another with the surface 8 m above that of the lower tank. The delivery pipe is 30 m long, 100 bore diameter and has a friction coefficient of 0.003 . The pump impeller is 500 mm diameter and revolves at $600 \mathrm{rev} / \mathrm{min}$. The pump is geometrically similar to another pump with an impeller 550 mm diameter which gave the data below when running at $900 \mathrm{rev} / \mathrm{min}$.

| $\Delta H(\mathrm{~m})$ | 37 | 41 | 44 | 45 | 42 | 36 | 28 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathrm{Q}\left(\mathrm{m}^{3} / \mathrm{s}\right)$ | 0 | 0.016 | 0.32 | 0.048 | 0.064 | 0.08 | 0.096 |

Determine the flow rate and developed head for the pump used.

## SOLUTION

First determine the head flow characteristic for the system.
$\Delta \mathrm{H}=$ developed head of the pump $=8+4 \mathrm{fLu} 2 / 2 \mathrm{gd}+$ minor losses
No details are provided about minor losses so only the loss at exit may be found.
$h_{L}=4 f L u^{2} / 2 g d+u^{2} / 2 g$
$\Delta \mathrm{H}==8+4 \mathrm{fLu}^{2} / 2 \mathrm{gd}+\mathrm{u}^{2} / 2 \mathrm{~g}$
$\mathrm{u}=4 \mathrm{Q} / \pi \mathrm{d}^{2}=127.3 \mathrm{Q}$
$\Delta \mathrm{H}=8+4 \mathrm{x} 0.003 \times 30000(127.3 \mathrm{Q})^{2} /(2 \mathrm{~g} \times 0.1)+(127.3 \mathrm{Q})^{2} / 2 \mathrm{~g}$
$\Delta H=8+3800 \mathrm{Q}^{2}$
Produce a table and plot $\Delta \mathrm{H}$ against Q for the system.

| $\Delta \mathrm{H}(\mathrm{m})$ | 8 | 8.38 | 14.08 | 32.3 | 46 |
| :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathrm{Q}\left(\mathrm{m}^{3} / \mathrm{s}\right)$ | 0 | 0.01 | 0.04 | 0.08 | 0.1 |

Plot the system head and pump head against flow and find the matching point.
This is at $\mathrm{H}=34.5$ and $\mathrm{Q}=0.084 \mathrm{~m}^{3} / \mathrm{s}$
Next determine the head - flow characteristic for the pump actually used by assuming dynamic and geometric similarity.

Flow Coefficient $\mathrm{Q} / \mathrm{ND}^{3}=$ constant
$\begin{array}{lr}\mathrm{Q} 2=\mathrm{Q}_{2}\left(\mathrm{~N}_{1} / \mathrm{N}_{2}\right)\left(\mathrm{D}_{1}{ }^{3} / \mathrm{D}_{2}{ }^{3}\right) & \mathrm{Q} 2=(600 / 900)(500 / 550)^{3}=0.5 \mathrm{Q}_{1} \\ \Delta \mathrm{H} /(\mathrm{ND})^{2}=\text { constant } & \\ \Delta \mathrm{H}_{2}=\Delta \mathrm{H}_{1}\left(\mathrm{~N}_{2} \mathrm{D}_{2} / \mathrm{N}_{1} \mathrm{D}_{1}\right)^{2} & \Delta \mathrm{H}_{2}=\Delta \mathrm{H}_{1}\{600 \times 500 / 900 \times 550\}^{2}=0.367 \Delta \mathrm{H}_{1}\end{array}$
Produce a table for the pump using the coefficients and data for the first pump.

| $\mathrm{H}_{2}(\mathrm{~m})$ | 13.58 | 15.05 | 16.15 | 16.51 | 15.41 | 13.21 | 10.28 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathrm{Q}_{2}\left(\mathrm{~m}^{3} / \mathrm{s}\right)$ | 0 | 0.08 | 0.016 | 0.024 | 0.032 | 0.04 | 0.048 |

Plot this graph along with the system graph and pick off the matching point.

Figure 3
Ans. 13.5 m head and $38 \mathrm{dm} 3 / \mathrm{s}$ flow rate.

## SELF ASSESSMENT EXERCISE No. 1

1. A centrifugal pump must produce a head of 15 m with a flow rate of $40 \mathrm{dm} 3 / \mathrm{s}$ and shaft speed of $725 \mathrm{rev} / \mathrm{min}$. The pump must be geometrically similar to either pump A or pump B whose characteristics are shown in the table below.

Which of the two designs will give the highest efficiency and what impeller diameter should be used ?

Pump A $\quad \mathrm{D}=0.25 \mathrm{~m} \quad \mathrm{~N}=1000 \mathrm{rev} / \mathrm{min}$

| $\mathrm{Q}(\mathrm{dm} 3 / \mathrm{s})$ | 8 | 11 | 15 | 19 |
| :--- | :--- | :--- | :--- | :--- |
| $\mathrm{H}(\mathrm{m})$ | 8.1 | 7.9 | 7.3 | 6.1 |
| $\eta \%$ | 48 | 55 | 62 | 56 |

Pump B D $=0.55 \mathrm{~m} \quad \mathrm{~N}=900 \mathrm{rev} / \mathrm{min}$

| $\mathrm{Q}\left(\mathrm{dm}^{3} / \mathrm{s}\right)$ | 6 | 8 | 9 | 11 |
| :--- | :--- | :--- | :--- | :--- |
| $\mathrm{H}(\mathrm{m})$ | 42 | 36 | 33 | 27 |
| $\eta \%$ | 55 | 65 | 66 | 58 |

Answer Pump B with D= 0.455 m
2. Define the Head and flow Coefficients for a pump.

Oil is pumped through a pipe 750 m long and 0.15 bore diameter. The outlet is 4 m below the oil level in the supply tank. The pump has an impeller diameter of 508 mm which runs at 600 $\mathrm{rev} / \mathrm{min}$. Calculate the flow rate of oil and the power consumed by the pump. It may be assumed $\mathrm{C}_{\mathrm{f}}=0.079(\mathrm{Re})^{-0.25}$. The density of the oil is $950 \mathrm{~kg} / \mathrm{m}^{3}$ and the dynamic viscosity is 5 x $10^{-3} \mathrm{~N} \mathrm{~s} / \mathrm{m}^{2}$.

The data for a geometrically similar pump is shown below.
$\mathrm{D}=0.552 \mathrm{~m} \quad \mathrm{~N}=900 \mathrm{rev} / \mathrm{min}$

| $\mathrm{Q}\left(\mathrm{m}^{3} / \mathrm{min}\right)$ | 0 | 1.14 | 2.27 | 3.41 | 4.55 | 5.68 | 6.86 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :---: |
| $\mathrm{H}(\mathrm{m})$ | 34.1 | 37.2 | 39.9 | 40.5 | 38.1 | 32.9 | 25.9 |
| $\mathrm{\eta} \%$ | 0 | 22 | 41 | 56 | 67 | 72 | 65 |

Answer $2 \mathrm{~m} 3 / \mathrm{min}$ and 7.89 kWatts

## 3. GENERAL THEORY

A Centrifugal pump is a Francis turbine running backwards. water between the rotor vanes experiences centrifugal force flows radially outwards from the middle to the outside. As it flows, it gains kinetic energy and when thrown off the outer of the rotor, the kinetic energy must be converted into flow energy. The use of vanes similar to those in the Francis wheel helps. The correct design of the casing is also vital to ensure efficient low friction conversion from velocity to pressure. The water enters the middle of the rotor without swirling so we know $\mathrm{v}_{\mathrm{W} 1}$ is always zero for a c.f. pump. that in all the following work, the inlet is suffix 1 and is at inside of the rotor. The outlet is suffix 2 and is the outer edge rotor.

Fig. 1 Basic Design

The increase in momentum through the rotor is found as always by drawing the vector diagrams. At inlet $\mathrm{v}_{1}$ is radial and equal to $\mathrm{v}_{\mathrm{r}} 1$ and so $\mathrm{v}_{\mathrm{W} 1}$ is zero. This is so regardless of the vane angle but there is only one angle which produces shockless entry and this must be used at the design speed.

At outlet, the shape of the vector diagram is greatly affected by the angle. The diagram below shows typical vector diagram when the is swept backwards (referred to vane velocity $u$ ).

Fig. 2
$\mathrm{v}_{\mathrm{w} 2}$ may be found by scaling
from the diagram. We can also apply trigonometry to the diagram as follows.
$\mathrm{v}_{\mathrm{w} 2}=\mathrm{u}_{2}-\frac{\mathrm{v}_{\mathrm{r} 2}}{\tan \alpha_{2}}=\mathrm{u}_{2}-\frac{\mathrm{Q}}{\mathrm{A}_{2} \tan \left(\alpha_{2}\right)}=\mathrm{u}_{2}-\frac{\mathrm{Q}}{\pi \mathrm{kD}_{2} \mathrm{t}_{2} \tan \left(\alpha_{2}\right)} \quad \mathrm{u}_{2}=\pi \mathrm{ND}_{2}$
$t$ is the height of the vane and $k$ is the correction factor for the blade thickness.
3.1. DIAGRAM POWER
D.P. $=m \Delta u v_{W}$
since usually $\mathrm{v}_{\mathrm{W} 1}$ is zero this becomes
D.P. $=m u_{2} \mathrm{~V}_{\mathrm{W}_{2}}$

### 3.2. WATER POWER

W.P. $=m g \Delta h$
$\Delta \mathrm{h}$ is the pressure head rise over the pump.

### 3.3. MANOMETRIC HEAD $\Delta h_{m}$

This is the head that would result if all the energy given to the water is converted into pressure head. It is found by equating the diagram power and water power.

$$
\mathrm{mu}_{2} \mathrm{v}_{\mathrm{w} 2}=\mathrm{mg} \Delta \mathrm{~g}_{\mathrm{m}} \quad \Delta \mathrm{~h}_{\mathrm{m}}=\frac{\mathrm{u}_{2} \mathrm{v}_{\mathrm{w} 2}}{\mathrm{~g}}=\frac{\mathrm{u}_{2}}{\mathrm{~g}}\left\{\mathrm{u}_{2}-\frac{\mathrm{Q}}{\mathrm{~A}_{2} \tan \left(\alpha_{2}\right)}\right\}
$$

### 3.4. MANOMETRIC EFFICIENCY $\eta_{\mathrm{m}}$

$$
\eta_{\mathrm{m}}=\frac{\text { Water Power }}{\text { Diagram Power }}=\frac{\mathrm{mg} \Delta \mathrm{~h}}{\mathrm{mu}_{2} \mathrm{v}_{\mathrm{w} 2}}=\frac{\mathrm{mg} \Delta \mathrm{~h}}{\mathrm{mg} \Delta \mathrm{~h}_{\mathrm{m}}}=\frac{\Delta \mathrm{h}}{\Delta \mathrm{~h}_{\mathrm{m}}}
$$

### 3.5. SHAFT POWER

S.P. $=2 \pi \mathrm{NT}$
3.6. OVERALL EFFICIENCY $\quad \eta_{o / a}=\frac{\text { Water Power }}{\text { Shaft Power }}$

### 3.7. KINETIC ENERGY AT ROTOR OUTLET <br> $$
\text { K.E. }=\frac{\mathrm{mv}_{2}^{2}}{2}
$$

Note the energy lost is mainly in the casing and is usually expressed as a fraction of the K.E. at exit.

### 3.8. NO FLOW CONDITION

There are two cases where you might want to calculate the head produced under no flow condition. One is when the outlet is blocked say by closing a valve, and the other is when the speed is just sufficient for flow to commence.

Under normal operating conditions the developed head is given by the following equation.

$$
\Delta \mathrm{h}=\frac{\mathrm{u}_{2} \mathrm{v}_{\mathrm{w} 2}}{\mathrm{~g}}=\frac{\mathrm{u}_{2}}{\mathrm{~g}}\left\{\mathrm{u}_{2}-\frac{\mathrm{Q}}{\mathrm{~A}_{2} \tan \left(\alpha_{2}\right)}\right\}
$$

When the outlet valve is closed the flow is zero. The developed head is given by the following equation. $\quad \Delta \mathrm{h}=\frac{\mathrm{u}_{2}}{\mathrm{~g}}\left\{\mathrm{u}_{2}-0\right\}=\frac{\mathrm{u}_{2}^{2}}{\mathrm{~g}}$
When the speed is reduced until the head is just sufficient to produce flow and overcome the static head, the radial velocity $\mathrm{v}_{\mathrm{r} 2}$ is zero and the fluid has a velocity $\mathrm{u}_{2}$ as it is carried around with the rotor. The kinetic energy of the fluid is $\frac{\mathrm{mu}_{2}^{2}}{2}$ and this is converted into head equal to the static head. It follows that $h_{s}=\frac{u_{2}^{2}}{2 g}$. Substituting $u_{2}=\frac{\pi N D_{2}}{60}$ we find that $N=83.5 \frac{\sqrt{h_{s}}}{D}$.

## WORKED EXAMPLE No. 4

A centrifugal pump has the following data :
Rotor inlet diameter
$\mathrm{D}_{1}=40 \mathrm{~mm}$
Rotor outlet diameter
Inlet vane height
Outlet vane height
$\mathrm{D}_{2}=100 \mathrm{~mm}$

Speed
Flow rate
Blade thickness coefficient $\quad \mathrm{k}=0.95$
The flow enters radially without shock.
The blades are swept forward at 300 at exit.
The developed head is 5 m and the power input to the shaft is 170 Watts.
Determine the following.
i. The inlet vane angle
ii. The diagram power
iii. The manometric head
iv. The manometric efficiency
v. The overall efficiency.
vi. The head produced when the outlet valve is shut.
vii. The speed at which pumping commences for a static head of 5 m .

## SOLUTION

$\mathrm{u}_{1}=\pi \mathrm{ND}_{1}=2.97 \mathrm{~m} / \mathrm{s}$
$\mathrm{u}_{2}=\pi \mathrm{ND}_{2}=7.435 \mathrm{~m} / \mathrm{s}$
$\mathrm{v}_{\mathrm{r}_{1}}=\mathrm{Q} / \mathrm{k} \pi \mathrm{D}_{1} \mathrm{~h}_{1}=0.307 \mathrm{~m} / \mathrm{s}$
$\mathrm{v}_{\mathrm{r} 2}=\mathrm{Q} / \mathrm{k} \pi \mathrm{D}_{2} \mathrm{~h}_{2}=0.368 \mathrm{~m} / \mathrm{s}$
Since the flow enters radially $\mathrm{v}_{1}=\mathrm{v}_{\mathrm{r}_{1}}=0.307 \mathrm{~m} / \mathrm{s}$ and $\mathrm{v}_{\mathrm{w} 1}=0$
From the inlet vector diagram the angle of the vane that produces no shock is found as follows: $\tan \alpha_{1}=0.307 / 2.97$ hence $\alpha_{1}=5.90$.

Fig. 41
Inlet vector diagram

From the outlet vector diagram we find :

Fig. 42
Outlet vector diagram
$\mathrm{v}_{\mathrm{W}_{2}}=7.435+0.368 / \tan 300=8.07 \mathrm{~m} / \mathrm{s}$
D.P. $=\mathrm{mu}_{2} \mathrm{~V}_{\mathrm{W}_{2}}$
D.P. $=2.2 \times 7.435 \times 8.07=132$ Watts
W.P. $=m g \Delta \mathrm{~h}=2.2 \times 9.81 \times 5=107.9$ Watts
$\Delta \mathrm{h}_{\mathrm{m}}=$ W.P./D.P. $=107.9 / 132=81.7 \%$
$\Delta \mathrm{h}_{\mathrm{m}}=\mathrm{u}_{2} \mathrm{v}_{\mathrm{W}_{2}} / \mathrm{g}=7.435 \times 8.07 / 9.81=6.12 \mathrm{~m}$
$\Delta_{\mathrm{m}}=\Delta \mathrm{h} / \Delta \mathrm{h}_{\mathrm{m}}=5 / 6.12=81.7 \%$
$\eta_{\mathrm{o} / \mathrm{a}}=$ W.P./S.P. $=107.9 / 170=63.5 \%$
When the outlet valve is closed the static head is $\Delta \mathrm{h}=\frac{\mathrm{u}_{2}^{2}}{\mathrm{~g}}=\frac{7.435^{2}}{9.81}=5.63 \mathrm{~m}$
The speed at which flow commences is $\mathrm{N}=83.5 \frac{\sqrt{\mathrm{~h}_{\mathrm{s}}}}{\mathrm{D}}=83.5 \frac{\sqrt{5}}{0.1}=1867 \mathrm{rev} / \mathrm{min}$

## SELF ASSESSMENT EXERCISE No. 2

1. The rotor of a centrifugal pump is 100 mm diameter and runs at $1450 \mathrm{rev} / \mathrm{min}$. It is 10 mm deep at the outer edge and swept back at 300 . The inlet flow is radial. the vanes take up $10 \%$ of the outlet area. $25 \%$ of the outlet velocity head is lost in the volute chamber. Estimate the shut off head and developed head when $8 \mathrm{dm}^{3} / \mathrm{s}$ is pumped. ( 5.87 m and 1.89 m )
2. The rotor of a centrifugal pump is 170 mm diameter and runs at $1450 \mathrm{rev} / \mathrm{min}$. It is 15 mm deep at the outer edge and swept back at 300 . The inlet flow is radial. the vanes take up $10 \%$ of the outlet area. $65 \%$ of the outlet velocity head is lost in the volute chamber. The pump delivers $15 \mathrm{dm} 3 / \mathrm{s}$ of water.

Calculate
i. The head produced. ( 9.23 m )
ii. The efficiency. (75.4\%)
iii. The power consumed. (1.8 kW)
